What is a Bot?

A programmer has the ability to create computer programs that become bots. “Pretend to Be a Bot, Rehumanize the Web” goes to discuss how AI can be created to have emotion or do one specific job. The human/machine relationship can be blurred as a result of innovation or new creation based on a programmer’s interference. The article discusses the issue of people still wanting bots and wrestling with A.I acceptance now. Some examples from the reading even have people changing how far bots can be manipulated in programmings.

Purposely being a bot can create opportunities for both the audience and the programmer themselves. Reading “I Will Say Whatever You Want In Front of a Pizza” a story narrated based on found screenshots and videos mentioned in the reading helped me picture the humor and discovery of acting like a bot. I then read later on that people who implanted manipulated data called easter eggs held hidden messages in production defined as people pretending to be bots. The reading then goes into companies competing over powerful AI’s being rented by people; indicating that the creators are software extensions in these networks. AI’s being necessary in the recent modern era of technology can be a way to mess with people and show the true need for them.

“After all, we’re already at a stage where people have to pretend to be bots because real bots are just not good enough”. Leaving AI to do everything is not always a good thing as mistakes can be made from self-driving cars accidents that might sacrifice the human lives, or smart homes that accidentally cause injury to the person. It is as if people want to go back to a time where AI did not exist with humans actually being more present to the audience. Over time as this generation gains a full understanding as to what programs can do, you can see why people dislike bots as mistakes; according to the original programmer.

AI can be traced back to that one single programmer typing in those codes. The human and machine relationship mixed together can either create mistakes or beautiful solutions. People who complain about AI being distrustful might not have to worry as the programmers can have a big impact to the point that the bot can act just as human. You can say that the internet cares more about trust online that they want to basically eliminate AI and create human comfort in their homes.
