A Possible Future?

A future that has more advanced A.I.'s can either be bad or good according to the human mind. "Towards a Poetics of Artificial Superintelligence" goes on to talk about two type of A.I.'s that either have the same human capacity or more. There is a great emphasis on how a human brain interprets the world compared to A.I. that sees humans as a life form. You see that if humans were in a world controlled by A.I. it would be unthinkable by the human brain. Reading the article helps me see a different perspective from two A.I.'s as if they were aliens. The idea of referring Artificial intelligence to aliens makes sense as it can be referred to the unknown.

An alien can be defined as the unknown and anthropomorphised from the human concept. The article goes on to discuss that when depicting aliens on movies, images, and ect., you find that these "aliens" are put in the image of human imagery; such as walking on two legs, and have the same facial structures. A.I. is then discussed to be its own alien species as it can be a mystery to people. Other forms of artificial intelligence being the ASI (exceeds human behavior) and AGI (follows the same human intelligence are concepts not yet made in our world are show the extent of what A.I. can be. After learning about these two types it makes me think that we do not understand what is made through our creations as it could enslave us. Movies such as

"Terminator" depict how far A.I. could go showing a enslavement, and the extent to what intelligence can be.

As someone who grep up in a era with technology with smartphones, and etc. shows that this theory is not so far from reality. We as humans see one another such as feeling for each other, as intelligence sees people as life forms that have more control of the planet than other species. In order for humans to have dominance over their creations they need to not get ahead of himself and take understanding/creation step by step. After reading this article it makes me realize as imperfect humans we make failures but can create A.I.'s that can aid us in a way that it will not exceed; it just takes failure to continue forward for the future.
